

Feature Request & Public Roadmap Portal

Canny / Featurebase Alternative

🔒 Universal Security & Architecture Requirements

- **Pair Token Auth:** Short-lived JWT Access Token (15m) + Long-lived Refresh Token (7d) in `httpOnly` cookies.
- **Auth Features:** Signup with Email Verification simulation, Login with token rotation, Forgot/Reset Password.
- **UI Standard:** Build all interface components using coss.com/ui primitives.

1. Overview & Goal

Build a customer feedback platform that captures user suggestions, allows upvoting and threaded discussions, and manages accepted features on a live 3-column public Kanban roadmap.

2. Technical Feature Specifications

A. Feature Request Submission & Feed

- Modal form with validation to submit title, rich markdown description, and category tags (*UI/UX, Integrations, Performance, General*).
- Dynamic feed displaying request cards with author info, status badges, vote count, and comment count.
- Sorting (*Most Upvoted / Trending, Newest, Most Discussed*) and filtering by category/status.

B. Atomic Upvoting Engine & Optimistic UI

- Prevents duplicate votes per user by leveraging atomic MongoDB operators (`$addToSet` , `$pull` , `$inc`).
- Optimistic UI updates on frontend with instant rollback on request failure.
- Unauthenticated users clicking upvote are prompted with a login/signup modal.

C. Threaded Discussions & Moderation

- Threaded comments on individual feature request pages with markdown support.
- Author and Admin permissions to edit or delete comments.

D. Admin Controls & Public Kanban Roadmap

- Admin panel with Role-Based Access Control (RBAC) to transition post status (`Under Review` → `Planned` → `In Progress` → `Completed`).
- Public 3-column Kanban Roadmap view that synchronizes with backend state changes.

E. Search & System UX

- Debounced full-text search across titles and descriptions.
- Loading skeletons, empty state placeholders, and toast notifications built with Coss UI.

3. Deliverables Checklist

Area	Deliverable Criteria
Auth & Security	Dual-token JWT auth, route guards, secure cookie handling, password recovery.
Database	Mongoose schemas (User, Post, Comment), atomic vote handling, pagination queries.
Frontend	Coss UI components, 3-column Kanban board, optimistic upvote state.
Repository	Clean GitHub repo, sample <code>.env.example</code> , API documentation.
