

Technical Assessment – Project Development

Overview

As part of the assessment process, you are required to select **one project** from the project options provided in the assessment folder and develop it as a working application.

You may choose **any one of the five projects** based on your interests and use either of the following technology stacks:

- **MERN Stack** – MongoDB, Express.js, React.js, Node.js
- **Python** – You may use an appropriate Python-based framework and supporting technologies.

The objective of this assessment is to evaluate your ability to understand requirements, design a solution, develop a functional application, and explain your technical decisions.

1. Select a Project

Five project requirements have been provided in the assessment folder.

Project Folder:

Open the Assessment Project Folder:

https://drive.google.com/drive/folders/1FT80Y_ooy6ffj_r0TNLOetK1s4ynNjy?usp=sharing

Instructions

- Review all five project PDFs.
 - Select **any one project** of your choice.
 - Read and understand the complete requirements before starting development.
 - You are expected to implement the core requirements mentioned in the selected project.
 - You may add additional features if they improve the project, but the primary requirements should be completed first.
-

2. Technology Stack

You can choose **either MERN or Python** for your implementation.

Option 1 – MERN

You can use:

- MongoDB

- Express.js
- React.js
- Node.js

You are free to use additional libraries or frameworks where appropriate.

Option 2 – Python

You can use:

- Python
- Django, Flask, FastAPI, or another suitable Python framework
- Any appropriate database and supporting technologies

Important

There is no requirement to use a specific framework within the selected stack.

We are more interested in:

- Your understanding of the problem
- Code quality
- Application architecture
- Functionality
- Database design
- API implementation
- UI/UX
- Technical decision-making

3. Development Requirements

Build the selected project as a **working application**.

Your implementation should:

- Cover the major requirements mentioned in the selected project PDF.
- Have a functional frontend and backend wherever applicable.
- Store and retrieve data appropriately.
- Implement required APIs and business logic.
- Handle basic validation and error cases.
- Have a clean and understandable project structure.
- Follow reasonable coding and development practices.

You may use third-party libraries, frameworks, APIs, or other tools where required.

If you use any external service, library, API, or significant third-party component, clearly mention it in your project documentation and explain why you chose it.

4. Git Repository

Once your project is completed, push the complete source code to **one public Git repository**.

The repository must be publicly accessible so that the assessment team can review your code.

Your repository should ideally contain:

- Complete source code
- README.md
- Setup instructions
- Environment variable requirements
- Database setup instructions, if applicable
- API documentation, if applicable
- Any other information required to run the project

README

Your README should explain, at minimum:

1. Project name
2. Project description
3. Technology stack used
4. How to install dependencies
5. How to configure environment variables
6. How to run the project locally
7. Database setup, if required
8. Any assumptions or limitations

Do not commit passwords, API keys, access tokens, database credentials, or other secrets to the repository.

5. Project Explanation Video

After completing the project, record a video explaining your implementation.

The video should help us understand **what you built, how you built it, and why you made your technical decisions**.

The video should cover:

- Brief introduction to the project
- Problem statement and objective
- Features you implemented
- Technology stack used
- Why you selected the particular technology stack
- Application architecture and overall approach
- Database structure, if applicable
- Important APIs or backend logic
- Important frontend implementation
- Significant technical decisions
- Challenges you faced and how you solved them
- Any additional features you implemented
- Anything that is incomplete or could be improved

You may also demonstrate the working application during the video.

Video Requirements

- Upload the video to a platform where it can be accessed through a public link.
 - The video link must be accessible to the assessment team.
 - **Make sure the video permission is set so that anyone with the link can view it.**
 - Submit the **public video link** along with your assessment.
-

6. Final Submission

Before submitting, make sure you have the following:

Required

- ☐ One project selected from the five provided projects
- ☐ Working implementation of the selected project
- ☐ Source code uploaded to **one public Git repository**
- ☐ README with setup and project information
- ☐ Project explanation video recorded
- ☐ Public video link available
- ☐ Git repository link available
- ☐ All required details submitted through the assessment form

Submit Your Assessment

Open the Assessment Submission Form:

<https://forms.gle/UbEiStpegGWcYrHy8>

Please verify all links before submitting the form.

7. Evaluation Criteria

Your submission may be evaluated on the following areas:

Area	What We Look For
Requirement Understanding	How well you understood and implemented the selected project
Functionality	Whether the core features work correctly
Code Quality	Clean, readable, maintainable code
Architecture	Logical application and backend architecture
Database Design	Appropriate data modelling and database usage
API Development	Proper API structure, validation, and error handling
Frontend	Usability, responsiveness, and implementation quality
Problem Solving	How you approached and solved technical challenges
Technical Decisions	Understanding of why particular technologies or approaches were used
Documentation	Quality of README and setup instructions
Explanation	Clarity and depth of the project explanation video

8. Important Notes

- You may select **any one of the five projects**.
- You may use **MERN or Python**.
- You are free to use libraries and tools that help you complete the project.
- Do not copy an existing project from the internet or submit someone else's work.
- You should be able to explain the code and technical decisions made in your project.
- Keep your Git repository public until the assessment process is complete.
- Ensure that all submitted links are accessible without requesting additional permission.
- If something could not be completed, mention it honestly in your README and video and explain how you would approach it with additional time.

Final Submission Checklist

Project → Development → Public Git Repository → Explanation Video → Submission Form

Please make sure all required links and information are submitted through the assessment form before completing your submission.
